

Databases & Models In Django

What are models?

Large websites needs large amount of data to be stored.

Data for websites is stored in a database.

Data in a database is stored in form of tables / database tables.

Models allow us to create database tables.

What are models?

Models are the blueprint which can be used to create database tables.

Models are nothing but classes in Python.

Models are created in the models.py file.

To create a model student, simply create a class named student.
